# 预训练语言模型发展史

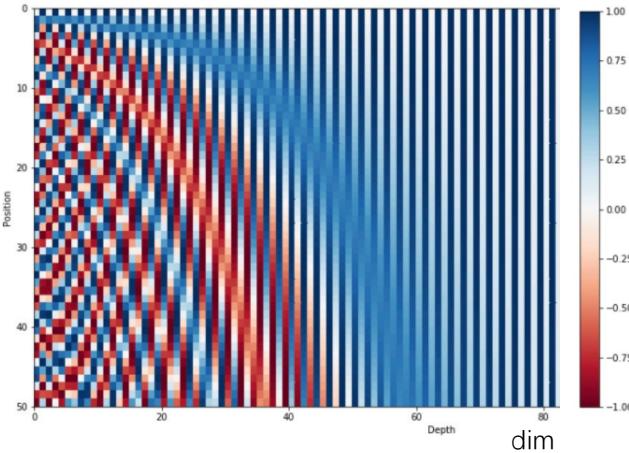

# 预训练语言模型发展史

# 预训练语言模型基础要素

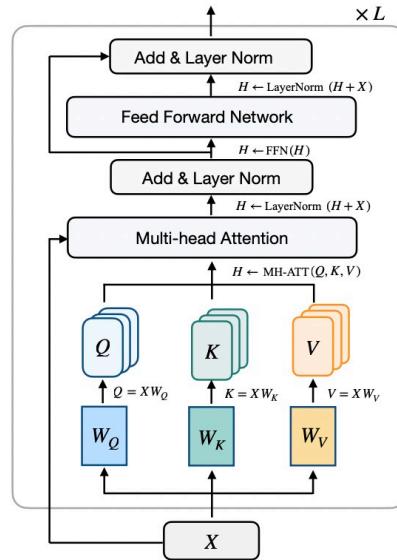

position

$$PE_{(pos,2i)} = \sin(pos/10000^{2i/d_{\text{model}}})$$

$$PE_{(pos,2i+1)} = \cos(pos/10000^{2i/d_{\text{model}}})$$

**Transformer**分词与位置表征

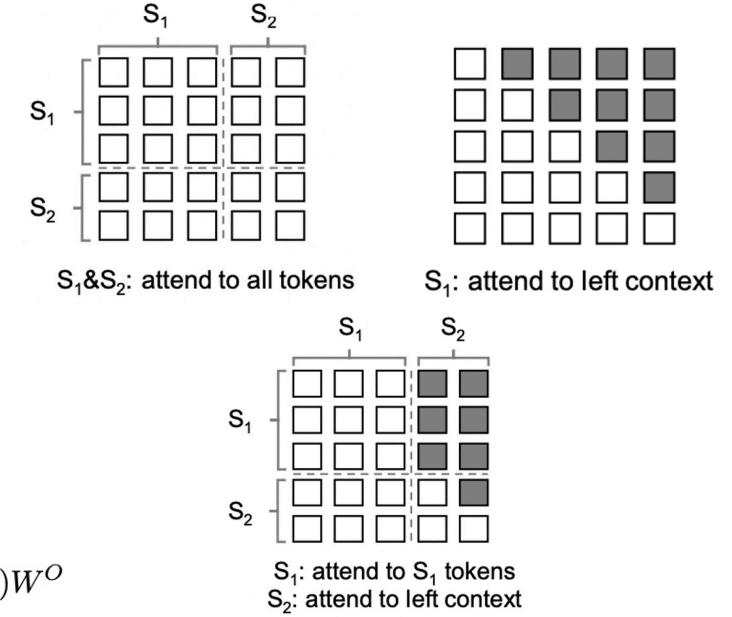

$$\text{MultiHead}(Q, K, V) = \text{Concat}(\text{head}_1, \dots, \text{head}_h)W^O$$

$$\text{where } \text{head}_i = \text{Attention}(QW_i^Q, KW_i^K, VW_i^V)$$

$$\text{Attention}(Q, K, V) = \text{softmax}\left(\frac{QK^T}{\sqrt{d_k}}\right)V$$

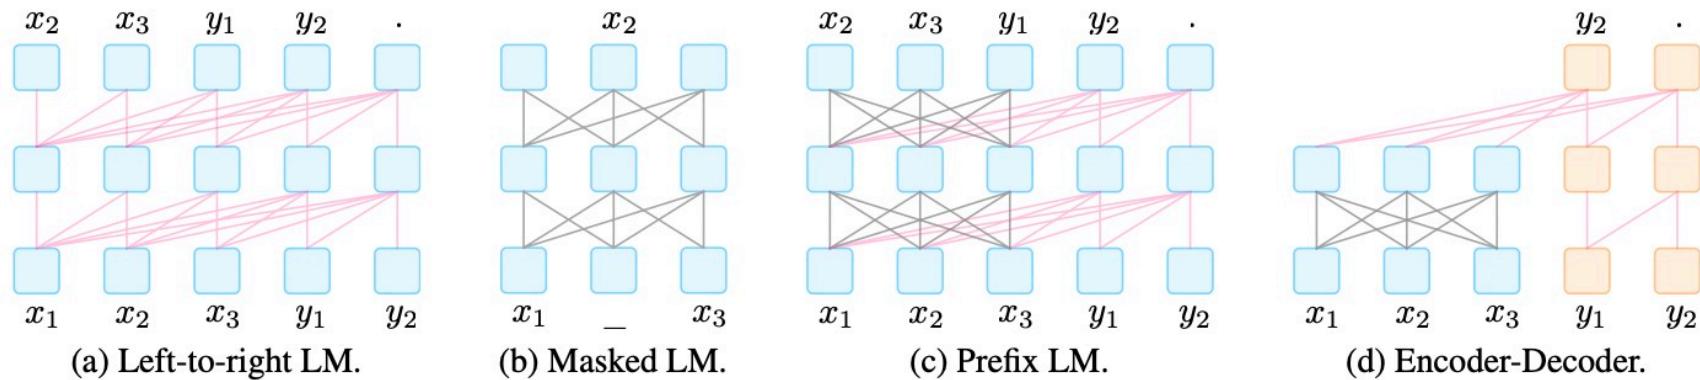

$$\text{Att}(\mathbf{Q}, \mathbf{K}, \mathbf{V}) = \text{Softmax}\left(\frac{\mathbf{Q}\mathbf{K}^T}{\sqrt{d}} + \mathbf{M}\right)\mathbf{V},$$

**Transformer**基础结构

预训练语言模型的范式：Pre-training + Fine-tuning

# 预训练语言模型主要类型

单向（因果）语言模型

代表：  
ELMO、SiATL  
GPT、GPT-2、GPT-3、GPT-4、GPT-J、  
OPT、ChatGPT、LLaMA、Alpaca

双向（掩码）语言模型

代表：  
BERT、MT-DNN、ELECTRA、SpanBERT、RoBERTa、ERNIE-THU、ERNIE-Baidu-1.0/2.0/3.0  
ALBERT、XLNet、DeBERTa、SpellBERT、MacBERT、CoLAKE、StructBERT、K-BERT、KEPLER、DKPLM、LayoutLM-V1/2/3、Longformer、Roformer

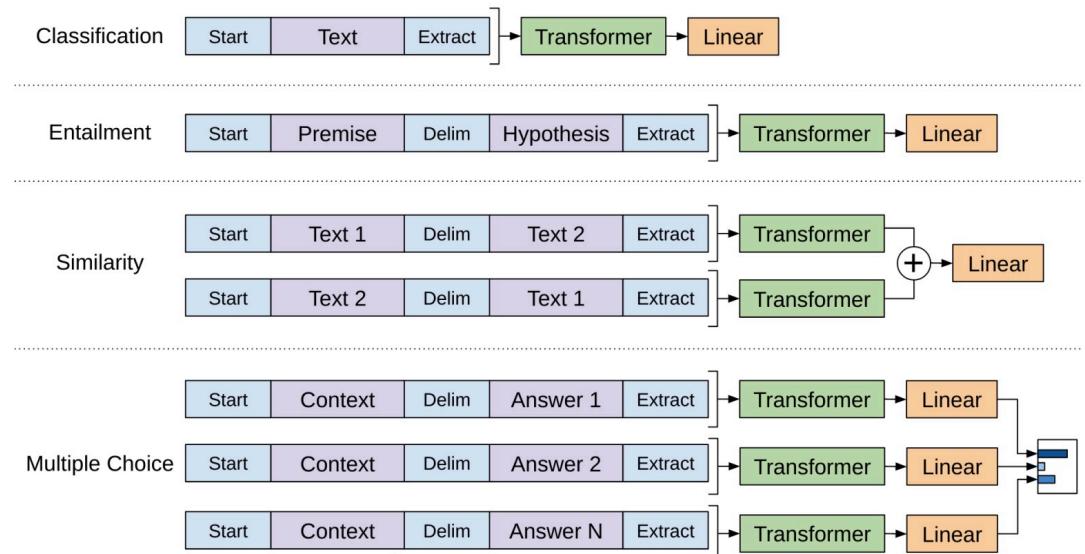

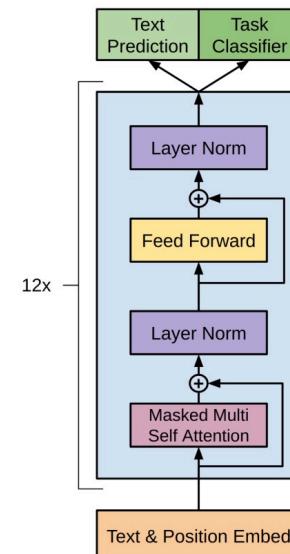

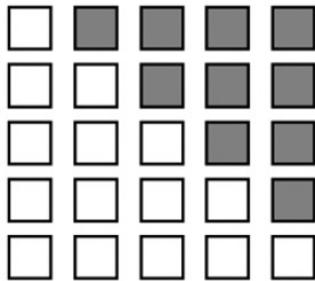

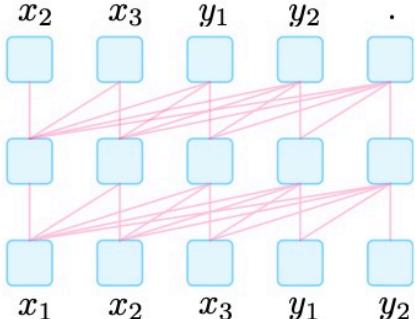

混合自回归

代表：  
UniLM、GLM、M6、BiET、VLMo

端到端语言模型

代表：  
BART、T5、MASS

# 单向语言模型——模型架构

GPT模型

单向语言模型特点：

- 只使用Transformer Decoder作为模型架构；
- Attention矩阵为Masked Attention；
- 具备很强的生成和推理能力；
- 广泛应用于对话系统、文本问答等；

## 单向语言模型——语料与训练样例

### 预训练语料

GPT-2: Reddit上的WebText，数据集共有约800万篇文章，累计体积约40G。

GPT-3: 共训练了5个不同的语料，分别是低质量的Common Crawl，高质量的WebText2，Books1，Books2和Wikipedia，GPT-3根据数据集的不同的质量赋予了不同的权值，权值越高的在训练的时候越容易抽样到。

### 预训练样例

Input: Google News releases that Apple founder Steve Jobs will speak about the new iPhone 4 product

Generation: Google News releases that Apple founder Steve Jobs will speak about the new iPhone 4 product **at a press conference in 2014.**

$$p(y_{i+1}, \dots, y_n | X = \{x_1, x_2, \dots, x_i\})$$

# 单向语言模型——Causal Language Modeling预训练

```
transformer_outputs = self.transformer(
    input_ids,
    past_key_values=past_key_values,
    attention_mask=attention_mask,
    token_type_ids=token_type_ids)

hidden_states = transformer_outputs[0]

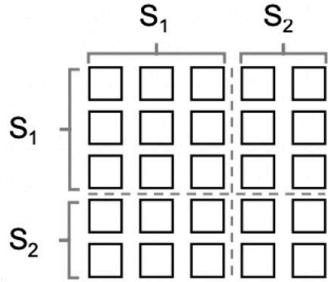

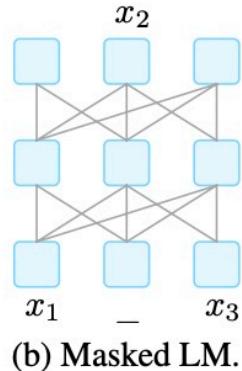

lm_logits = self.lm_head(hidden_states)

loss = None
if labels is not None:
    # Shift so that tokens < n predict n
    shift_logits = lm_logits[..., :-1, :].contiguous()
    shift_labels = labels[..., 1: ].contiguous()
    # Flatten the tokens
    loss_fct = CrossEntropyLoss()
    loss = loss_fct(shift_logits.view(-1, shift_logits.size(-1)), shift_labels.view(-1))

if not return_dict:
    output = (lm_logits,) + transformer_outputs[1:]
return ((loss,) + output) if loss is not None else output
```

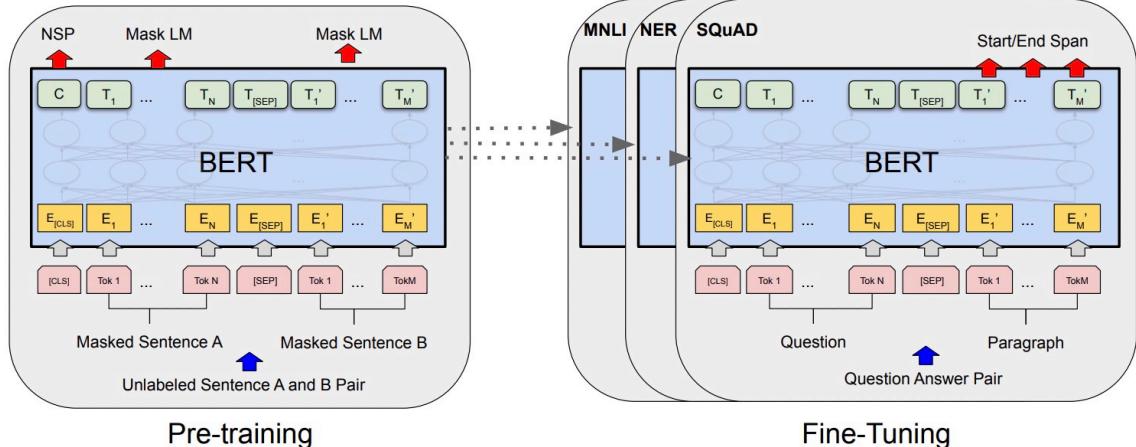

Input	CLS	今	天	天	气	真	好	,	我	们	一	起	出	去	玩	吧	BOS
Label	今	天	天	气	真	好	,	我	们	一	起	出	去	玩	吧	BOS	-100
Loss	0.1	0.4	0.3	0.7	0.2	0.1	0.4	0.3	0.7	0.2	0.1	0.4	0.3	0.7	0.2	0.2	-

## 双向语言模型——模型架构

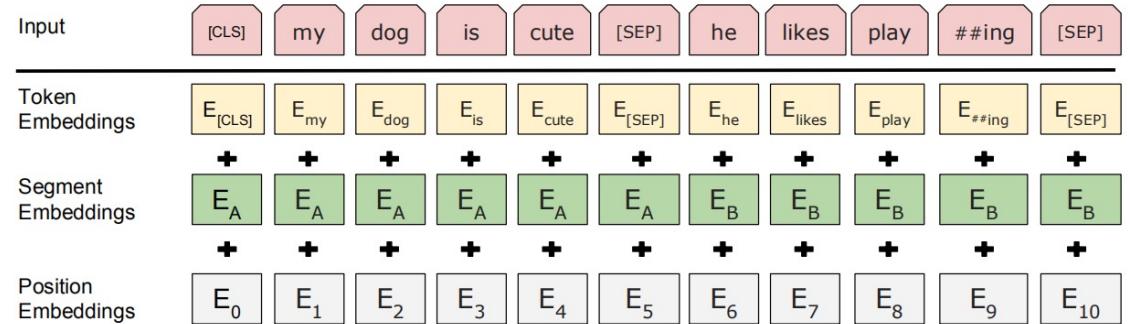

双向语言模型特点：

- 只使用Transformer Encoder作为模型架构；
- Attention矩阵中不存在Masking；
- 具备很强的语义理解能力；
- 广泛应用于文本分类、文本释义、信息抽取、阅读理解等；

BERT 模型

BERT Embedding

# 双向语言模型——语料与训练样例

## 预训练语料

英文领域：

Wikipedia、BookCorpus、CC-News、OpenWebText、Stories

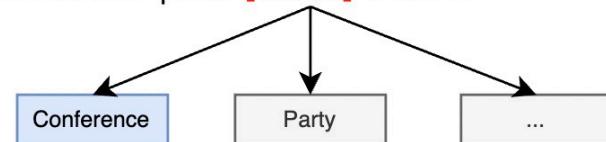

• 中文领域：

百度百科、维基百科（中文）、千言、wudao2.0

## 预训练样例：Masked Language Modeling (MLM)

Input: Google News releases that Apple founder Steve Jobs will speak about the new iPhone 4 product at a press conference in 2014.

MLM: Google News [MASK] that Apple [MASK] Steve Jobs will speak about the new iPhone 4 product at a press [MASK] in 2014.

$$p(y_j | X = \{x_1, x_2, \dots, x_n\}, x_j = [\text{MASK}])$$

语料构建：

- 对于每个文本，随机挑选15%的token；
- 对于被选中的token，其中：
  - 80%的token改为[MASK]；
  - 10%的token随机替换词表中其他token；
  - 10%的token保持不变；

拓展：

- 默认情况下，语料中有13.5%的token被训练。
- 实践中，被选中的token数量也可以更多，例如40%。

## 双向语言模型——Masked Language Modeling预训练

```
transformer_outputs = self.transformer(  
    input_ids,  
    attention_mask=attention_mask,  
    token_type_ids=token_type_ids,  
    position_ids=position_ids)  
  
sequence_output = transformer_outputs[0]  
  
prediction_scores = self.cls(sequence_output)  
  
masked_lm_loss = None  
if labels is not None:  
    loss_fct = CrossEntropyLoss() # -100 index = padding token  
    masked_lm_loss = loss_fct(prediction_scores.view(-1, self.config.vocab_size), labels.view(-1))  
  
if not return_dict:  
    output = (prediction_scores,) + outputs[2:]  
return ((masked_lm_loss,) + output) if masked_lm_loss is not None else output
```

Input	CLS	今	[MASK]	天	[MASK]	真	好	,	我	[MASK]	—	起	出	去	[MASK]	吧	SEP
Label	-100	-100	天	-100	气	-100	-100	-100	们	-100	-100	-100	-100	-100	玩	-100	-100
Loss	-	-	0.3	-	0.2	-	-	-	-	0.2	-	-	-	-	0.2	-	-

## 双向语言模型——其他典型的预训练

### Whole Word Masking MLM

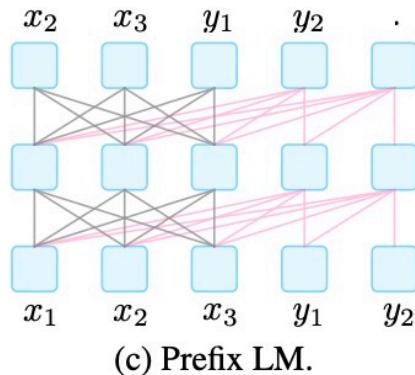

Input	CLS	今	天	[MASK]	[MASK]	真	好	,	[MASK]	[MASK]	—	起	[MASK]	[MASK]	[MASK]	吧	SEP
Label	-100	-100	-100	天	气	-100	-100	-100	我	们	-100	-100	出	去	玩	-100	-100

### Spell Correction

Input	CLS	令	天	夭	气	真	[MASK]	,	我	门	—	赴	[MASK]	[MASK]	玩	把	SEP
Label	-100	今	-100	天	-100	-100	好	-100	-100	们	-100	起	出	去	-100	吧	-100
Loss	0.1	-	0.3	-	-	0.1	-	-	0.7	-	0.1	0.4	0.3	-	0.2	-	

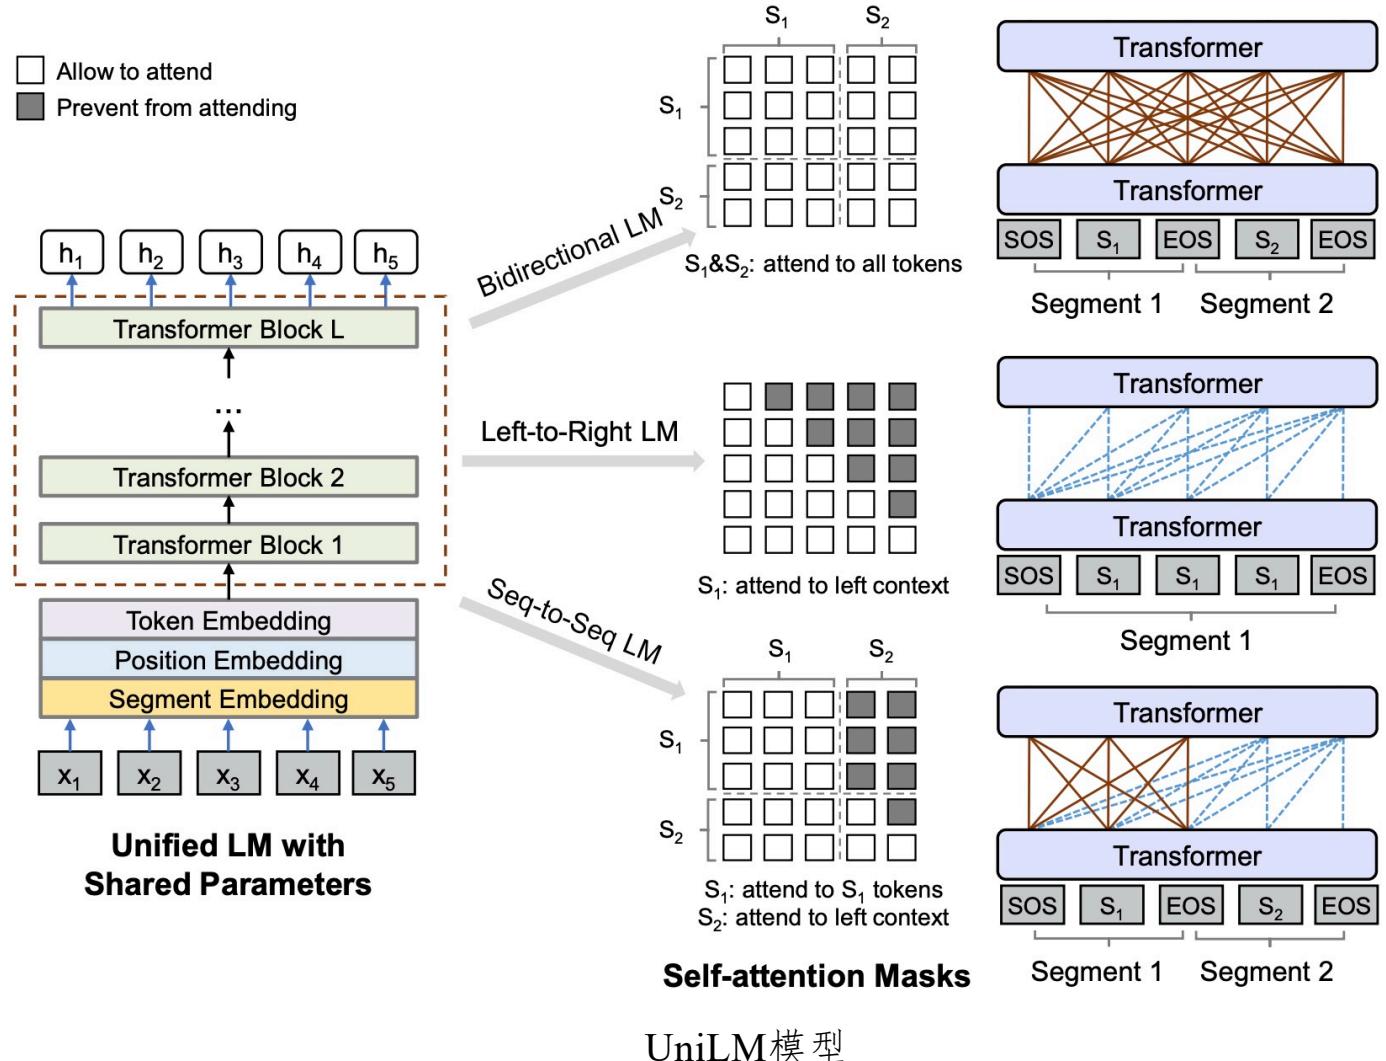

预训练任务本质是一种自监督训练、自我寻找、构建标签实现在大量语料中学习和理解自然语义知识

# 混合语言模型——模型架构

双向语言模型特点：

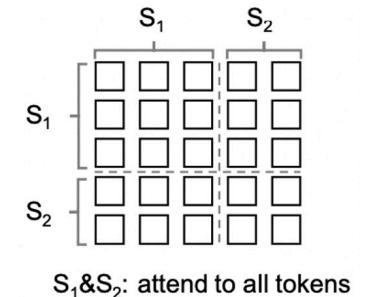

- 只使用Transformer Encoder作为模型架构；
- 根据Attention矩阵的Masking设计，划分为双向、单向和单双混合三种情况；
- 既具备语言理解能力，又拥有文本生成能力；
- 广泛应用于文本摘要、机器翻译等；

# 混合语言模型——预训练

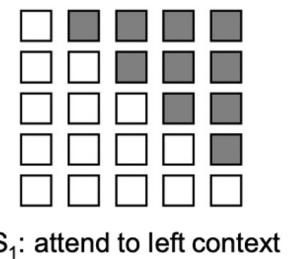

## 仅双向Mask预训练

Input	SOS	今	[MASK]	天	[MASK]	真	好	,	我	[MASK]	—	起	出	去	[MASK]	吧	BOS
Label	-100	-100	天	-100	气	-100	-100	-100	们	-100	-100	-100	-100	玩	-100	-100	
Loss	-	-	0.3	-	0.2	-	-	-	0.2	-	-	-	-	0.2	-	-	

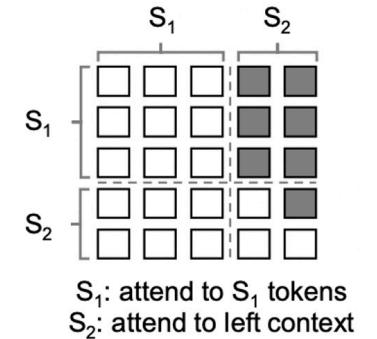

## 仅单向Causal预训练

Input	SOS	今	天	天	气	真	好	,	我	们	一	起	出	去	玩	吧	BOS
Label	今	天	天	气	真	好	,	我	们	一	起	出	去	玩	吧	BOS	-100

## 混合Mask & Causal预训练

Input	SOS	今	天	[MASK]	气	真	[MASK]	EOS	我	们	一	起	出	去	玩	吧	BOS
Label	-100	-100	-100	天	-100	-100	好	我	们	一	起	出	去	玩	吧	BOS	-100
Loss	-	-	-	0.3	-	-	0.1	0.4	0.3	0.7	0.2	0.1	0.4	0.3	0.7	0.2	-

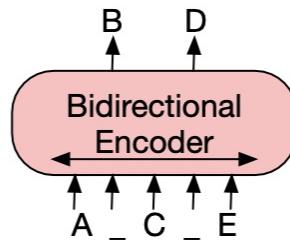

## 端到端语言模型——模型架构

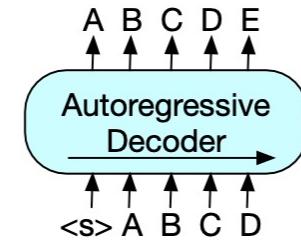

端到端语言模型特点：

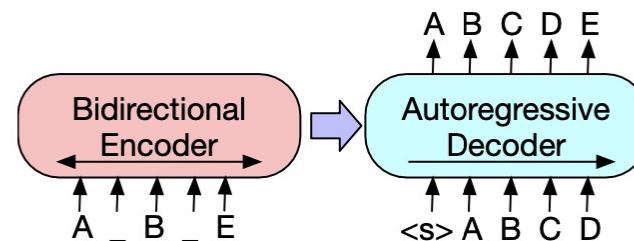

- 同时使用Transformer Encoder和Decoder作为模型架构；
- Encoder只负责对输入文本进行编码； Decoder则负责自回归生成；
- 既具备语言理解能力，又拥有文本生成能力；
- 广泛应用于文本摘要、机器翻译等；

(a) BERT: Random tokens are replaced with masks, and the document is encoded bidirectionally. Missing tokens are predicted independently, so BERT cannot easily be used for generation.

(b) GPT: Tokens are predicted auto-regressively, meaning GPT can be used for generation. However words can only condition on leftward context, so it cannot learn bidirectional interactions.

(c) BART: Inputs to the encoder need not be aligned with decoder outputs, allowing arbitrary noise transformations. Here, a document has been corrupted by replacing spans of text with mask symbols. The corrupted document (left) is encoded with a bidirectional model, and then the likelihood of the original document (right) is calculated with an autoregressive decoder. For fine-tuning, an uncorrupted document is input to both the encoder and decoder, and we use representations from the final hidden state of the decoder.

BART模型、T5模型

# 端到端语言模型——Conditional Generation预训练

```
# Convert encoder inputs in embeddings if needed
encoder_outputs = self.encoder(
    input_ids=input_ids,
    attention_mask=attention_mask,
)

hidden_states = encoder_outputs[0]

if labels is not None and decoder_input_ids is None and decoder_inputs_embeds is None:
    # get decoder inputs from shifting lm labels to the right
    decoder_input_ids = self._shift_right(labels)

# Decode
decoder_outputs = self.decoder(
    input_ids=decoder_input_ids,
    attention_mask=decoder_attention_mask
```

```
sequence_output = decoder_outputs[0]

lm_logits = self.lm_head(sequence_output)

loss = None
if labels is not None:
    loss_fct = CrossEntropyLoss(ignore_index=-100)
    loss = loss_fct(lm_logits.view(-1, lm_logits.size(-1)), labels.view(-1))

if not return_dict:
    output = (lm_logits,) + decoder_outputs[1:] + encoder_outputs
return ((loss,) + output) if loss is not None else output
```

Input	SOS	今	天	天	气	真	好	,	我	们	—	起	出	去	玩	吧	BOS
Label	今	天	天	气	真	好	,	我	们	—	起	出	去	玩	吧	BOS	-100
Loss	0.1	0.4	0.3	0.7	0.2	0.1	0.4	0.3	0.7	0.2	0.1	0.4	0.3	0.7	0.2	0.2	-

# 预训练语言模型的优化——数据优化

## 超大规模数据

大规模高质量语料

- 英文领域：  
Wikipedia、BookCorpus、CC-News、OpenWebText、Stories
- 中文领域：  
百度百科、维基百科（中文）、千言、wudao2.0

## 超大规模参数

模型架构加深加宽

- BERT/RoBERTa-large: 770M
- Erlangshen: 1.3B
- Nezha: 4B
- GPT-3: 175B
- M6: 1000B
- Switch-Transformer: 1600B

## 超大规模算力

大规模分布式深度学习训练

- 混合精度FP16
- MOE训练
- ZeRO-Offload
- Deepspeed分布式
- Megatron

# 预训练语言模型的优化——数据优化

Gradient Clipping	0.0	0.0

- 增加数据量、batch size、迭代次数
- 在 pre-training 和 fine-tuning 之间增加 continual pre-training
- Trick：使用梯度累积来增大 batch size
- 缺陷：难以获得高质量语料，对低资源语言不友好

- int8量化
- 梯度累积
- Gradient checkpointing
- Torch FSDP
- CPU offloading

## 梯度累积:

一轮Batch样本计算梯度后，并不立刻进行参数更新，而是等待多轮Batch的梯度之后再进行参数更新。本质上等价于扩大了Batch size。

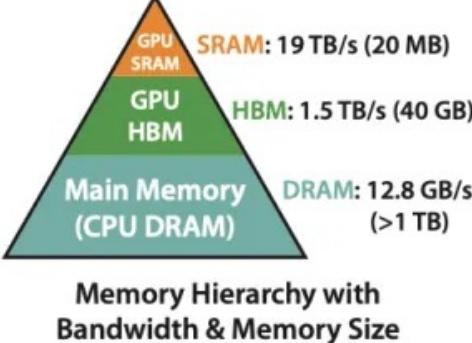

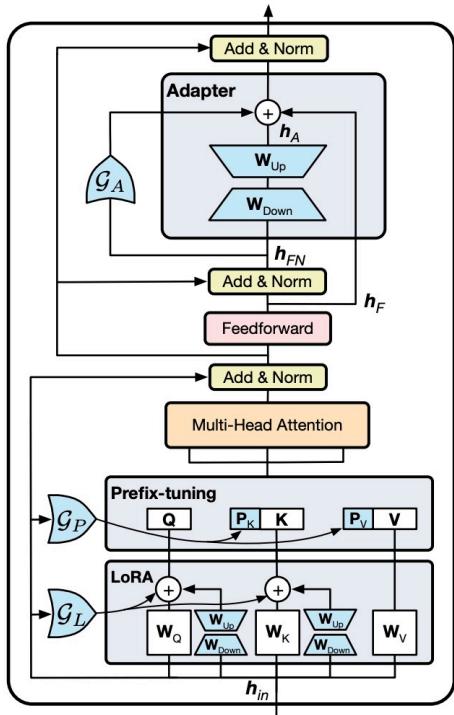

## Gradient Checkpointing:

在进行反向传播计算梯度时，并不存储每个张量（算子）的梯度，而是重新计算梯度，消除了显式存储梯度所占用的显存。

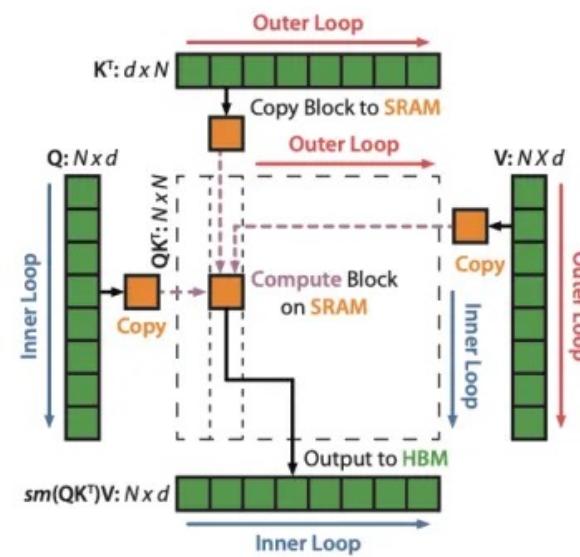

## Torch FSDP+CPU Offloading:

Pytorch实现的分布式训练框架，同时借助CPU内存实现存储。需要频繁地执行内存与显存之间的数据通信。

## Instructions for MC-TACO question generation task

- **Title:** Writing questions that involve commonsense understanding of "event duration".
- **Definition:** In this task, we ask you to write a question that involves "event duration", based on a given sentence. Here, event duration is defined as the understanding of how long events typically last. For example, "brushing teeth", usually takes few minutes.
- **Emphasis & Caution:** The written questions are not required to have a single correct answer.
- **Things to avoid:** Don't create questions which have explicit mentions of answers in text. Instead, it has to be implied from what is given. In other words, we want you to use "instinct" or "common sense".

### Positive Example

- **Input:** Sentence: Jack played basketball after school, after which he was very tired.
- **Output:** How long did Jack play basketball?
- **Reason:** the question asks about the duration of an event; therefore it's a temporal event duration question.

### Negative Example

- **Input:** Sentence: He spent two hours on his homework.
  - **Output:** How long did he do his homework?
  - **Reason:** We DO NOT want this question as the answer is directly mentioned in the text.
  - **Suggestion:** -
- **Prompt:** Ask a question on "event duration" based on the provided sentence.

### Example task instances

#### Instance

- **Input:** Sentence: It's hail crackled across the comm, and Tara spun to retake her seat at the helm.
- **Expected Output:** How long was the storm?

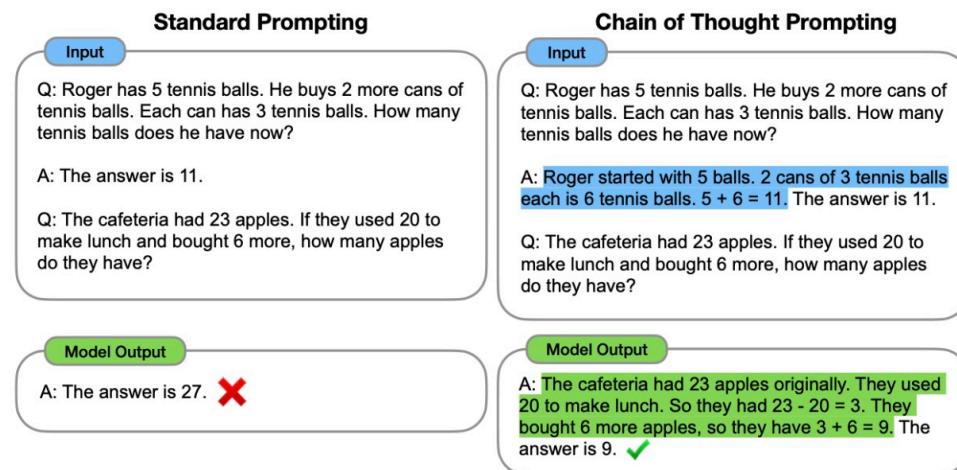

⋮

#### Instance

- **Input:** Sentence: During breakfast one morning, he seemed lost in thought and ignored his food.
- **Expected Output:** How long was he lost in thoughts?

人工标注推理路径

- Q:** There are 15 trees in the grove. Grove workers will plant trees in the grove today. After they are done, there will be 21 trees. How many trees did the grove workers plant today?  
**A:** There are 15 trees originally. Then there were 21 trees after some more were planted. So there must have been  $21 - 15 = 6$ . The answer is 6.
- Q:** If there are 3 cars in the parking lot and 2 more cars arrive, how many cars are in the parking lot?  
**A:** There are originally 3 cars. 2 more cars arrive.  $3 + 2 = 5$ . The answer is 5.
- Q:** Leah had 32 chocolates and her sister had 42. If they ate 35, how many pieces do they have left in total?  
**A:** Originally, Leah had 32 chocolates. Her sister had 42. So in total they had  $32 + 42 = 74$ . After eating 35, they had  $74 - 35 = 39$ . The answer is 39.
